Q: Disabling an Options option depending on other options in dplyr I am using the following data: `library(dplyr) library(tidyr) # Data Source x %>% filter(Country!="Canada")` Now I want to get rid of the row on Canada based on `Country=Japan`. For this I want to use the following code: `x %>% group_by(Country) %>% mutate(country=replace(country,country=="Canada",0)) %>% #... do the rest of the modifications` But this gives an error `Error: unexpected symbol in: "x %>% group_by(Country) %>% mutate(country=replace(country,country=="Canada",0)) %>% "` But, if I use `x %>% group_by(Country) %>% mutate(country=ifelse(country=="Canada",0,country)) %>% #... do the rest of the modifications` it works fine. But I need to remove Canada independently of the other countries. How to do this with the code as above? Thanks in advance for your responses.

A: The code you've posted should work as is: `x %>% group_by(Country) %>% mutate(country=replace(country,country=="Canada",0)) %>% #... do the`

rest of the modifications However, it turns out the error is being thrown by the first line, which is: `group_by(Country`

Q: how to have an attribute that is an object I have the object structure

```
class Node{ private: std::string name; std::vector children; // More... }
```

But if a "name" is an object of type "string", how can I represent it? Is it possible to have something like this :

```
class Node{ private: std::string name; std::vector children; // More... } class Name{ std::string name; }
```

The main question is : I want to have the name of an object as a non-const reference : how can I do it? A: You can't have a "non-constant" name. It's just non-

constant. In your code, `std::string name` is a constant, as it's declared as such. Although, you could have a pointer to a `std::string` that can be non-const, but you have to store the pointer, and not the string instance itself.

```
class Node{  
private: std::string name; std::vector children; // More... }  
class Name{  
std::string name; };  
Node* test = new Node();  
test->name =
```
