We have emphasized the importance of understanding the natural history of solid organ transplantation, with an emphasis on prevention and early detection of complications. We have identified sleep disorders as a serious issue for transplant recipients, especially those who have received multiple medications to prevent rejection or preserve organ function. Our previous work has

demonstrated that the lack of sleep is associated with increased cardiovascular morbidity and mortality in a population of kidney transplant recipients. In collaboration with clinical investigators at the University of Pennsylvania, we have found that slow-wave sleep, a stage of sleep characterized by reduced arousal threshold and decreased activation, is markedly decreased in organ transplant patients. Moreover, subclinical cardiac dysfunction, as assessed by cardiac imaging, appears to be present in these individuals. Further work in collaboration with the Sleep Disorders Center at the Hospital of the University of Pennsylvania has demonstrated that slow-wave sleep in kidney transplant recipients is inversely associated with severity of pain and mental stress. Taken together, this work suggests that slow-wave sleep may be an integral aspect of coping with the effects of chronic illness. We have joined the organ procurement organization to form the

Pennsylvania Organ Procurement Organization Transplant Special Interest Group. We work in collaboration with transplant centers to assist them in better screening and management of transplant patients.

Handling Surveillance Phones

A young man, in the name of mental health, locked himself up in a closet for the past month. A young man, in the name of mental health, locked himself up in a closet for the past month. When he couldn't go any longer, he called an ambulance and they brought in their "psychiatric assessment team," which he refused to talk to and found out he had been filming his conversations with them. He was taken away in handcuffs and arrested. Let's say he was sane, and so they do what anyone sane would do - take all his possessions, including his phone, and hold him against his will as he's obviously a mentally unstable person. But there's a problem with all of that, since I, as a surveillance watchdog, have this problem with "their" phone.

Why? Well, here's the thing:
